

SentinellQ Banking Anomaly Detection Report

Executive Summary

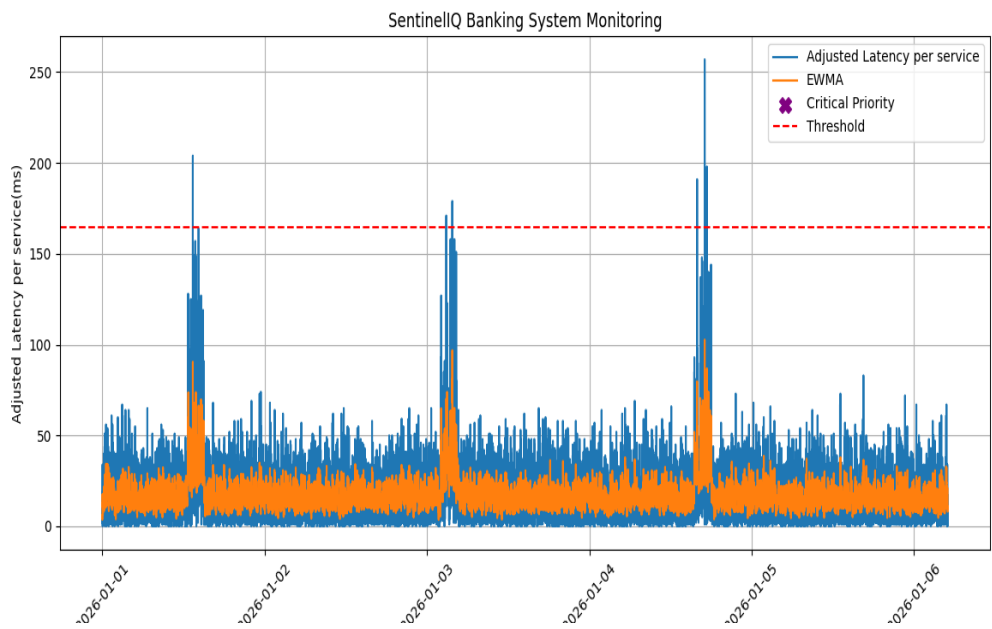

SENTINELIQ OPERATIONAL SUMMARY

Total Incidents : 15000 Critical Incidents : 0 High Incidents : 407 Medium Incidents : 1538 This report provides an overview of simulated banking logs, observed anomalies, service failures, and system health metrics. Key findings include:

- Increased authentication failures during peak traffic.
- Elevated fraud detection alerts from payment-api.
- Trading-engine latency spikes observed intermittently.
- Isolation Forest identified suspicious transaction patterns.

Overall system stability remained acceptable, though multiple high-severity anomalies require operational review.

Anomaly Trend Visualization

Service Error Summary

Observations

The anomaly distribution indicates that most failures originated from authentication and payment processing systems. The fraud-detection service generated fewer events but showed higher severity anomalies. Further monitoring and alert correlation is recommended.
